What is Price Action Trading?

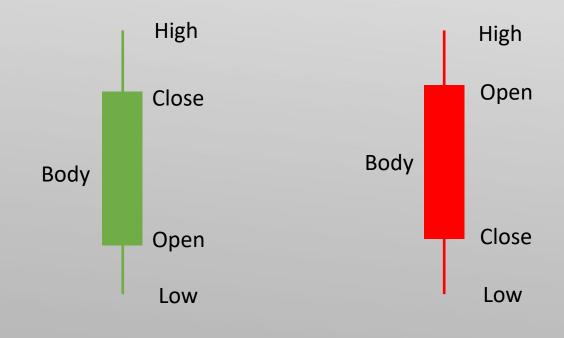

Price action trading is a methodology for financial market speculation which consists of the analysis of basic price movement across time. It's used by many retail traders and often by institutional traders and hedge fund managers to make predictions on the future direction of the price of a security or financial market.

Bullish Pin Bar

Bearish Pin Bar

What is Volume?

Volume is a measure of quantity in trading. Volume is the amount of a particular asset traded over a period of time. It is the number of units of shares or contracts that change hands between buyers and sellers.

Volume is an important indicator of market activity and liquidity, which means it often provides price information.

Validation & Anomaly

When analyzing price volume we always look for two main signals.

Whether the price is observed in terms of volume If the price change is corrected in terms of volume, it is a trend continuation

If there is an anomaly in the volume of the price as opposed to the volume of the price, there is an indication of a possible change in the trend

Effort vs Result

understanding the effort vs Result, Effort reflects volume. While the result shows the price. If the size of the candlestick is large, then the volume bar should be large. Which shows price Validation, If the candlestick size is small and the volume bar is small, it indicates validation.

If the size of the candlestick does not match with the volume bar size, it indicates an anomaly in price and volume.

An anomaly between two candles indicates weakness in the formation that the price will reverse at recent support and resistance.

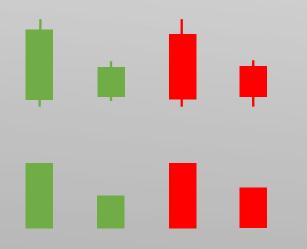

Understanding more about volume Read each candlestick with volume to give an idea of the strength and weakness of the trend, which can indicate the continuation and reversal of the candlestick.
